

The IVO incorporates two magnetic resonance

The Valencian Institute of Oncology Foundation (IVO) has incorporated two magnetic resonance imaging into its radiodiagnosis service, a device with which the center reinforces its technological endowment by offering important improvements for the diagnosis and subsequent treatment of cancer patients.

The new resonances acquired by the IVO Foundation offer higher image quality and definition, providing specific details that cannot be seen in other radiology tests and that help detect cancer in the body and identify possible signs of the spread of the disease. which leads to a more accurate diagnosis and better planning of cancer treatment with surgery, chemotherapy or radiotherapy.

The new MRIs allow for faster studies, reducing acquisition times, reducing the time of examinations and customizing it to the physical needs of cancer patients
